

Case Study

Sealed Air, Kettering - Permanent Walkway Systems

Higham Roofing Ltd are one of the UK's leading specialist roof refurbishment contractors

Problem

For a large and prestigious organisation such as Sealed Air, health and safety are of key importance and this factor had to be taken into consideration in the regular cleaning

activities of three large extractor vents. Our company was required to provide safe regular access to the vents and also to two other metal roof areas.

Solution

We commissioned a bespoke permanent lightweight walkway system to be designed. We installed it with all of the health and safety provisions taken into consideration. The walkway had access channels to the perimeter as well as to the vents so they can be accessed quickly and safely. This new walkway system is convenient and HSE compliant as opposed to the 'youngmans boards' that were in use previously.

Benefits

Our company enabled Sealed Air to meet their Health and Safety compliances and now the walkway system provides a safe route for the maintenance operatives to access two roof areas and also the vents. In addition, the walkway systems financially benefits our client due to the fact that it removes the need to scaffold the building every time

maintenance works are carried out on the roofs.

We at Higham Roofing Limited are confident of our abilities and we strive to offer bespoke financially beneficial and long term roofing solutions for any requirements.

Our mission: “to ensure our clients are aware of technically correct solutions to achieve project specific value for money”
